

Our projects are designed to meet current needs whilst safeguarding the needs of future generations. This is the fundamental basis of sustainable design, which is interpreted through our specification of materials and energy systems, through layout design and the creation of, or the integration into existing communities.

The Practice has delivered many projects which push the boundaries in terms of sustainability and affordable energy efficiency. To ensure that we remain at the forefront of design expertise, we have undertaken specialist training to achieve accreditation in energy assessment; we have in-house Licensed **Ecohomes** and **Code for Sustainable Homes** assessors, making us the *only Private Practice in Scotland with in-house assessors for both standards*. We can also provide certification under Section 6 of the Building Standards.
